#### Reassembling the Mechanism Unit

- 1. For repair, measurement or adjustment with the mechanism removed from the unit be sure to ground the lower base plate of the mechanism.
- For grounding, connect a extension cord to the mechanism's lower base plate and the lug terminal from amplifier printed circuit board.
- Without grounding, the mechanism does not operate properly. (Refer to Fig. 11).

Equipment:

#### L-CH/R-CH output balance adjustment

- 1. Make connections as shown in fig. 2.
- 2. Playback the 8kHz signal from the test tape (QZZCFM). Adjust screw (B) in fig. 3 for maximum output L-CH and R-CH levels. When the output levels of L-CH and R-CH are not at maximum at the same point adjust as follows.
- 3. Turn screw (B) shown in fig. 3 to find angles A and C (points where peak output levels for left and right channels are obtained). Then, locate angle B between angles A and C, i.e., and point where L-CH and R-CH outputs are balanced. (Refer to figs. 3 and 4.)

#### L-CH/R-CH phase adjustment

- 4. Make connections as shown in fig. 5.
- 5. Playback the 8kHz signal from the test tape (QZZCFM). Adjust screw (B) shown in fig. 3 so that pointers of the two VTVMs swing to maximum and a lissajous waveform as illustrated in fig. 6 is obtained on the oscilloscope.

#### Tape speed accuracy

- 1. Test equipment connection is shown in fig. 7.
- 2. Playback test tape (QZZCWAT 3,000 Hz), and supply playback signal to the digital frequency counter.
- 3. Measure this frequency.
- 4. On the basis of 3,000 Hz, determine value by following formula:

Tape speed accuracy =  $\frac{f-3,000}{3,000}$ where, f = measured value

5. Take measurement at middle section of tape.

Standard value: ±1.5%

6. If measured value is not within the standard value, adjust it by using the tape speed adjustment VR shown in Fig. 1.

#### Tape speed fluctuation

Make measurements in same manner as above (beginning, middle and end of tape), and determine the difference between maximum and minimum values and calculate as follows:

Tape speed fluctuation =  $\frac{f_1 - f_2}{3.000} \times 100(\%)$  $f_1 = maximum value, f_2 = minimum value$ 

Standard value: Less than 1%

#### NOTE:

Please use non metal type screwdriver when you adjust tape speed on this unit.

#### Check for FL meter

To check the accuracy of the FL meter, measure the output level at test point [TP3 (L-CH), TP4 (R-CH)].

- Make connections as shown (See fig. 16).
   Connect a wire between TP201 and TP202 terminal (See fig. 17).
- 3. In the recording pause mode, apply 1kHz (-24dB) to LINE IN.
- 4. Adjust ATT so that output level at test point [TP3 (L-CH), TP4 (R-CH)] is 0.28 V.

#### Checking FL meter 0dB segment display ON/OFF

Change the output level at test point [TP3 (L-CH), TP4 (R-CH)] from 0.28 V -1dB (≒250 mV) to 0.28 V +1dB (≒310 mV) by adjusting the attenuator, and check that the FL meter 0dB segment display OFF state changes to the ON state.

Fig. 16

#### Checking FL meter -40dB segment display ON/OFF

Lower the signal level 28dB below the standard input level (-24dB-28dB= -52dB=2.5mV) and then further lower the level 12dB (-52dB-12dB = -64dB = 0.63mV) by adjusting the attenuator. While lowering the level as described above, make sure that only the -40dB display remains lit the dims or goes off at the lowest level.

#### Adjustment for FL meter

- Make connections as shown (See fig. 16). Connect a wire between TP201 and TP202 terminal (See fig. 17).
- In the recording pause mode, apply 1kHz (-24dB) to LINE IN.
- 4. Adjust ATT so that output level at test point [TP3 (L-CH), TP4 (R-CH)] is 0.28 V.

#### -40dB adjustment

- 5. Adjust ATT so that the level adjusted at step 4 is reuced by 40dB.
- At this time, check that -40dB indicator is dimmed (intermediate brightness between full brightness and light-out: See fig. 18).
- 7. If the indicator is not lighted halfway as described in step 6, adjust VR11.

#### 0dB adjustment

- 8. Restore the condition of step 4 (set output level to 0.28V at test point [TP3 (L-CH), TP4 (R-CH)].
- At this time, check that 0dB indicator is dimmed (intermediate brightness between full brightness and light-out (See fig. 19).
- 10. If improper, adjust VR201.
- 11. Repeat adjustments at steps 4, 5, 6, 7, 8, 9 and 10 two or three times. 12. Disconnect the wire between TP201 and TP202 terminal, which had been connected at step 2.

#### Comprobación del medidor fluorescente (FL)

Para comprobar la precisión del medidor FL, medir el nivel de salida en el punto de prueba [TP3 (L-CH), TP4 (R-CH).

- 1. Efectuar las conexiones tal como se muestra (ver la Fig. 16).
- 2. Conectar un cable entre TP201 y TP202 (ver la Fig. 17).
- 3. En el modo de pausa durante la grabación, aplicar 1kHz (-24dB) a LINE IN.
- 4. Ajustar el ATT de forma que el nivel de salida en el punto de prueba [TP3 (L-CH), TP4 (R-CH)] sea de 0,28 V.

### Comprobación del encendido/apagado del segmento 0dB del medidor FL

Cambiar el nivel de salida en el punto de prueba [TP3 (L-CH), TP4 (R-CH)] de 0,28 V-1dB (≒250 mV) a 0,28 V + 1dB (≒310 mV) ajustando el atenuador, y comprobar si el estado de apagado del segmento 0dB del medidor FL cambia al estado de encendi-

#### Comprobación del encendido/apagado del segmento -40 dB del medidor FL

Disminuir el nivel de la señal de 28dB por debajo del nivel de entrada normal (-24dB-28dB = -52dB = 2.5mV) y disminuir luego aún más el nivel de 12dB (-52dB-12dB = -64dB=0,63mV) ajustando el atenuador, Al mismo tiempo que se baja el nivel según se ha descrito arriba, asegurarse de que solamente el segmento de -40 dB permanece encendido, luego se atenúa o se apaga al nivel más bajo.

#### • Ajuste del medidor fluorescente

- 1. Efectuar las conexiones tal como se muestra (ver la Fig. 16).
- 2. Conectar un cable entre TP201 y TP202 (ver la Fig 17).

- 4. Ajustar ATT de forma que el nivel de salida en el punto de prueba [TP3 (L-CH), TP4 (R-CH)] sea de 0,28 V.

- 5. Ajustar ATT de forma que el nivel ajustado en el paso 4 se reduzca en 40dB.
- 6. En este momento, comprobar si el indicador de -40dB está iluminado a medias (intensidad luminosa intermedia entre intensidad máxima y apagado: ver la Fig. 18).
- 7. Si el indicador no esta iluminado a medias tal como se ha descrito en el paso 6, ajustar VR11.

- 8. Volver a las condiciones del paso 4 (hacer que el nivel de salida en el punto de prueba [TP3 (L-CH), TP4 (R-CH)] sea de 0,28 V.
- 9. En este momento, comprobar si el indicador de 0dB está iluminado a medias (intensidad luminosa intermedia entre intensidad máxima y apagado: ver la Fig. 19).
- 10. Si no es así, ajustar VR201.
- 11. Repetir los ajustes y comprobaciones de los pasos 4, 5, 6, 7, 8, 9, y 10, dos o tres veces.
- 12. Desconectar el cable entre TP201 y TP202 que se conectó en el paso 2.
